maize RIP, Trichosanthin, Ricin A-chain, Abrin-A A-chain and Saporin. The RIPs can be used in the construction of therapeutic coxins targeted to specific cells such as tumour cells via the attachment of a targeting polypeptide, e.g. a monoclonal antibody. A further use is in HIV therapy (see US4869903). There is interest in expressing RIP recombinantly in host eukaryotic cells, because of the capacity to provide correct post-translational processing viewer, RIPs effectively inhibit protein synthesis in eukaryotic cells resulting in cell death. Since the inactive RIP proteins are not cytotoxic to then converted to active RIP proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The luffin coding sequence was isolated from a cDNA library prepared from mRNA isolated from seeds of Luffa cylindrica. The cDNA will be useful for recombinant production of luffin, a ribosome inactivating protein. The protein inhibits protein synthesis and viral sequence 276 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Mean 32.689; Variance 57.122; scale 0.572

Mean 33.585; Variance 52.447; scale 0.640 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Cloning of the Saccharomyes cerevisiae gene whose overexpression overcomes the effects of HM-1 killer toxin, which inhibits beta-glucan synthesis.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   J. BACTERIOL. 176:1488-1499(1994).
-!- FUNCTION: COULD REGULATE BETA-GLUCAN SYNTHESIS. OVEREXPRESSION
-!- PROVIDES RESISTANCE TO HM-1 KILLER TOXIN.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN (PROBABLE).
-!- PTM: COULD BE O-GLYCOSYLATED IN SERINE/THREONINE RICH DOMAIN.
-! SIMILARITY: SOME, TO YEAST MSB2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              SACCHAROMYCES CEREVISIAE (BAKER'S YEAST).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Expression vector for expressing protein or polypeptide in mycobacterization vector for expressing protein or polypeptide in mycobacterization conto DNA sequences encoding lipoprotein flag. Secretion signal and peptide heterologous to bacteria expressing fusion protein of lipoprotein heterologous to bacteria expressing fusion protein of lipoprotein heterologous to bacteria protein protein fusion protein adomain 1 from the migrae of the protein 7n2603 ORF 3. The whole coding sequence of the enzyme could be included in an expression vector also includes at least the secretion into its host. The expression vector also includes at least the secretion signal of a lipoprotein and a second sequence encoding a heterologous protein and a mycobacterial promoter to control expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Simplex infection

Claim 1; Fig 4; 151pp; English.

Claim 1; Fig 4; 151pp; English.

The human tumour necrosis factor (TNF) receptor related protein (TR2) is a member of the TNF family and displays considerable homology to murine CD40. It can be used in soluble forms to treat herpes simplex virus infection and TR2 proteins (or their agonists or antagonists) are used to be used to protect against the effects of radiation therapy and to stimulate lymphocyte proliferation and differentiation in patients infected by human immune deficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Protein inhibiting activation of interleukin-8 promoter in response

PT to extracellular stimulus - for use in diseases involving

Interleukin-8 expression, such as inflammatory disorders and asthma

T interleukin-8 expression, such as inflammatory disorders and asthma

CC Tals sequence represents the human glucocorticoid inducible suppressor

CC Trus sequence represents the human glucocorticoid inducible suppressor

CC Trus promoter activity in response to a specific extracellular signal

CC (IL-8) promoter activity in response to a specific extracellular simulus

CC (Sepecially by Interleukin-1 beta). The invention can be used in the

CC treatment and prevention of disorders in which IL-8 expression is

CC Involved, such as inflammatory diseases, bronchial asthma, allergy and

Protein inhibiting activation of interleukin-8 promoter in response
Protein inhibiting activation of interleukin-8 promoter in response
Interleukin-8 expression, such as inflammatory disorders and asthma
claim 3; Page 46-50; 72pp; Japanese.
This sequence represents the rat glucocorticoid inducible suppressor
protein (GISP) of the invention. The GISP is a intracellular signal
transmission inhibitor, and inhibits the activation of interleukin-8
(IL-8) promoter activity in response to a specific extracellular stimulus
(especially by interleukin-1 beta). The invention can be used in the
treatment and prevention of disorders in which IL-8 expression is
involved, such as inflammatory diseases, bronchial asthma, allergy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ٠.;

Disclosure: Rage 8; 13pp; Japanese
The amino acid sequence is that of mutated SP6DNA polymerase,
amino acids His167-His172 have been deleted by site specific
mutation. This results in a mutant lacking 3',5'-exonuclease
activity. See also R14922-R14927.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

TAKARA POLYMETASE OF GETING SPECIAL PROPRIATION ACID SEQUENCE SPECIAL OF MULTATED SPECIAL PROPRIATION. Sequence 1s that of mutated SPEDNA POLYMETASE, when multation. See also R14922-R14926.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SP6DNA polymerase of defined sequence - and modified polymerase lacking 3',5'-exo-nuclease activity
Claim 1; Fig 1: 13pp: Japanese
The amino acid sequence 1s that of SP6DNA polymerase and was obt
from the SP6 phage. It can be produced recombinantly and is of
property, superior to conventional polymerases. See also R14923
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SP6DNA polymerase of defined sequence - and modified polymerase lacking 3',5'-exo-nuclease activity Disclosure; Page 8; 13pp; Japanese

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Packing 3',5'-exo-nuclease activity
lacking 3',5'-exo-nuclease activity
Disclosure: Page 8: 13pp; Japanese
The amino acid sequence is that of mutated SP6DNA polymerase, where
the His at position 167 has been changed by site specific mutation
to Glu, Glu170 to Lys and His172 to Asp. See also R14922-R14927.

DIA encoding Streptomyces fradiae tylactone synthase domain - for production of tylosin-related polyketide compounds
Example 2; Pages 172-178; 220pp; English.
W12606-W12510 represent proteins encoded by the platenolide synthase gene Cluster. The gene cluster is also referred to as the srmG gene, and was isolated from Streptomyces ambofaciens. These sequences are multi-functional proteins which direct the synthesis of the polyketide platenolide. Platenolide is the basic building block of the macrolide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                              cloned rhizobium meliloti ntrA gene - for use in C4-dicarboxylate transport, nitrate assimilation, symbiotic nitrogen fixation and identifying pathogenic genes.

Claim 1, Page 12, 19pp; English.

The ntrA gene product is a transcriptional activator. It controls the processes of nitrate assimilation, symbiotic nitrogen fixation and C4-dicarboxylate transport, working in conjunction with NrCC, NifA and DCtD resp. It can also be used to identify genes involved in
                                                    NtrA gene product.

NtrA; sigma factor; transcriptional activation; nitrogen assimilation; fixation; nif operon; C4-dicarboxylate transport.

Rhizobium meliloti.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    27-FEB-1998 (first entry)

for production of spiramycin-related polyketide antibiotics usualing production of spiramycin-related polyketide antibiotics.

Claim 8; Pages 71-77; Bipp; English.

W23116-W23720 represent proteins encoded by the platenolide synthase gene cluster of the invention. The gene cluster is also referred to as the same gene, and was isolated from Streptomyces ambofaciens. These sequences are multi-functional proteins which direct the synthesis of the polyketide platenolide. Platenolide is the basic building block of the macrolide antibiotic spiramycin. The DNA can be used to produce compounds exhibiting antibiotic spiramycin. The DNA can be used to produce compounds including specifically the macrolide antibiotic spiramycin and spiramycin analogues and derivatives. Modifications of the platenolide synthase DNA sequence can be made so as to change the number and type of carboxylic acids incorporated into the growing polyketide chain and to change the common of the chain and to change the consumer.

                                                                                                                                                                                                                                                                                                                                                    ö
antibiotic spiramycin. The DNA encoding this sequence was used along wit the tylG gene (see T80413) to create a hybrid ORF1 sequence (see T80415) The tylG gene is the tylactone synthase gene cluster of the invention. The tylG gene is the tylactone synthase gene cluster of the invention. The tylG sequence was isolated from Streptomyces fradiae, and encodes multifunctional proteins which direct the synthesis of the polyketide tylactone. Tylactone is the basic building block of the antibiotic tylosin. The hybrid sequence can be used to transform S. ambofaciens lacking the srmG ORF1 sequence, or S. fradiae lacking the tylG ORF1 sequence, so that they can produce polyketides. The DNA sequence can be modified so as to alter the type of carboxylic acids incorporated, the number of carboxylic acids incorporated, the reactions performed, thereby resulting in novel tylosin-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Platenolide synthase ORF5 protein.

New nucleic acid sequences from Staphylococcus aureus WCHU29 -
useful in vaccines and for treatment of bacterial infections of e.g.

Tespiratory tract and central nervous system

respiratory tract and central nervous system

PS Claim 11; Page 263; 390pp; English.

C This sequence represents a Staphylococcus aureus protein of unknown function, and is encoded by a DNA sequence of the invention.

C The DNA sequences were isolated from Staphylococcus aureus WCHU29

(WCIMB 40771). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides.

C Conditions which may be treated include bacterial infections, especially crespiratory, cardiac, gastrointestinal, central nervous, ege, kidney, curlnary tract, skin, bones and joints. The proteins can also be used to dentify antimicrobial compounds which are broad spectrum antibiotics, commence of the page of the proteins.
                                                                                                                                                    Staphylococcus aureus protein of unknown function.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 21.865; Variance 24.608; scale 0.889

##note
submitted sequence extracted from GenBank
NI Lamins A and C (see PIR:VEHULC) are products of alternative
splicing of the same gene.

NI The lamins (A, B, and C) contains several alpha-helical domains
capable of forming coiled coils.

NI The association of lamins, dependent upon ionic interactions, is
interrupted by hyperphosphorylation during the
interruptace-metaphase period of the cell cycle. The nuclear
envelope disintegrates with lamin dissociation; it does not
reform until telophase, when the lamins are dephosphorylated t
interphase levels and then reassociate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                *superfamily cytoskeletal keratin
